PROJECT PLANNING AND EXECUTION Planning, scheduling vs execution	• Ability to work as a group is missing. • No schedule, no project plan. • Work is done in a hurry. • Work is carried out only by certain individuals in the group. • Reflection (incl. self-evaluation and peer review) not made.	• Rough scheduling and planning of the execution of the work, the role of the supervisor large. • Significant slipping from the planned schedule, which is not communicated. • Minor self-initiative. • Feedback is poorly taken into account. • Work is unequally divided within the group. • Reflection done.	• The implementation of the work is largely following a realistic plan with small assistance of an instructor. • The plan has been refined if necessary as the work progresses. • Feedback taken into account quite well. • Work is equally divided within the group. • Reflection done.	• Clearly and independently implemented research plan and scheduling, which has been revised as the work progressed. • Work implementation and progress independently according to plan without significant delays due to work group. • Work carried out in schedule. • Feedback applied spontaneously • Work is equally divided within the group. • Reflection done.	15
	Insufficient level (0)	Sufficient level (1-2)	Good level (3-4)	Excellent level (5)	
REPORTS - PROJECT EXECUTION AND CONTENT Background research, information acquisition, and critical referencing	• Background research is missing. • Scientific references are not used at all. • Only few references. • The references are inappropriate. • References are not marked.	• Scarce references or references' scientific quality is poor. • References used in copy/paste manner. • Reference criticism is missing. • Inadequate background based partly on own opinion and thought without substantiated facts.	• Necessary initial information and facts reasonably presented. • References are referred using own words. • Good scientific publications referred. • Assessing the reliability of references and reference criticism is notable	• The work shows familiarity with background material. • Up-to-date references (also) used. • In addition to the necessary initial information also additional background information shown. • Essential issues are distinguished and own interpretations of the reference material is made.	10
Methods	• No criteria for the used methods or • selected methods are clearly wrong to solve the design problem. • No simulations used in the design.	• Design methods used in the work are presented briefly and their selection is poorly justified. • In applying methods there are shortcomings. • Theory is barely applied, the link between the methods and theory is weak or not all	• Design methods and possible experimental arrangements are adequate, justified and suitable for design problem • Authors point out that they master the used methods well. • Possible empirical material supports the goal of the work.	• The chosen research methods are justified in depth, • authors point out to master the chosen methods very well. • Possible empirical material is sufficiently broad to justify the conclusions.	25

		theories are suitable for design. • Collected material in the study shows clear shortcomings.	• The connection of theory with methods is observable and supported by theory.	• Application of the theory is diverse and solutions connect to it.	
Results, processing of results and management decisions	• The results obtained are questionable. • A possible empirical study is missed. • No conclusions. • Designed prototype is not made ready and doesn't work at all.	• Does not answer to design problem. • Possibly partially incorrect results / questionable methods and conclusions or work has been lacking. • Connection between theory and solutions / results is weak. • Results of the work have been analyzed and conclusions are drawn. • Main results are presented in an understandable way. • Conclusions are presented concisely, it remains unclear what is their own reflection • Designed prototype works somehow.	• Results reflect objectives and respond to given design problems. • Connection between the theory and the results is noticeable. • Results are reliable and reliability has been evaluated. • Work includes some own reflection. • Results of the work are clearly presented e.g. as text, images, tables, waveforms and of them own conclusions are made. • Designed prototype works but there are some minor problems.	• Results reflect objectives and respond to given design problems. • Results of the work have been critically analyzed with references to literature and conclusions are well justified. • Significant amount of own reflection. • The results reliability has been comprehensively assessed. • Processing the results shows clear own reasoning from authors and management of the design problem and the relevance of the results. • Designed prototype works as intended	25

REPORTS - STRUCTURE AND LAYOUT Structure and scientific presentation of the work	• There is no clear structure and the handling of the subject is inconsistent. • The presentation does not care about scientific notation. • Deficiencies in the table of contents in the citations and image / table texts, equation / figure / table numbers.	• Report structure and title inconsistent. • Shortcomings in the list of references. • Figures and tables were not explained.	• The work is clearly structured and follows well the principles of scientific writing. • There are no significant shortcomings in figures and tables captions. • The work forms a whole entity.	• Logical, precise and relevant suitable structure. • The work is progressing consistently. • Sections, titles, figures, tables, equations and the references are mutually supportive forming intact and easily interpretable entity. • There is a storyline.	

Power Electronic Converter Design

EVALUATION MATRIX

Appearance and linguistic expression	• Text is full of grammatical errors and typos. • Text is not scientific quality. • Inconsistent.	• Linguistically satisfactory writing, however the text is stiff and contains a lot grammatical errors. • The layout of the work inconsistent.	• The text is relevant and fulfills basic requirements for a scientific text. • May contain minor typos.	• The layout is clear and neat. • The text is clear, consistent, error-free and easy to read.	15
SEMINAR	Insufficient level (0)	Sufficient level (1-2)	Good level (3-4)	Excellent level (5)	
Seminar	• Work is not presented.	• The presentation is inconsistent and confusing, not focused on the relevant matter from the listener point-of-view. • Every member of the team does not have clear role in the presentation.	• Presentation as instructed, clear, illustrative and consistent, proceeds logically. • Takes into account the time allocated for the presentation. • Every member of the team presents a part of the project	• Presentation well prepared, designed, illustrative, focuses on the relevant matters. • Mastering of the content is visible. • Focus on work solutions and time limit well kept. • Every member of the team presents a part of the project.	10
